# HIGH PERFORMANCE COMPUTING: TOWARDS BETTER PERFORMANCE PREDICTIONS AND EXPERIMENTS

Tom Cornebize 2 June 2021, PhD defense

#### No science without computing

Arithmomètre (1851)

ENIAC (1945)

Fugaku (2021)

#### No science without computing

ENIAC (1945)

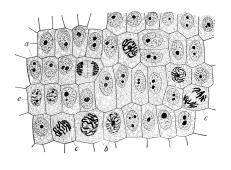

Fugaku (2021)

#### Last decades:

- Exponential performance improvements (e.g. sequencing an entire human genome costed \$100,000,000 in 2001, \$1000 now)
- At the price of complexity (both software and hardware)

#### EXPERIMENTAL STUDY OF COMPUTER PERFORMANCE

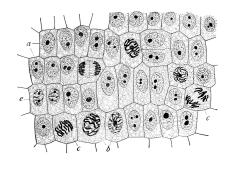

Similar to natural sciences

Complexity ⇒ Variability and Opacity

 $\Rightarrow$  No perfect model

 $\Rightarrow \text{Need for experiments}$ 

#### EXPERIMENTAL STUDY OF COMPUTER PERFORMANCE

Similar to natural sciences

 ${\sf Complexity} \Rightarrow {\sf Variability} \ {\sf and} \ {\sf Opacity}$ 

 $\Rightarrow$  No perfect model

⇒ Need for experiments

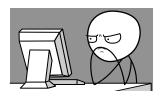

Experiments can be carried in reality or in simulation

**Typical Performance Evaluation Questions** (Given my application and a supercomputer)

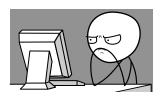

- · Before running
  - How many nodes?
  - For how long?
  - · Which parameters?

**Typical Performance Evaluation Questions** (Given my application and a supercomputer)

- · Before running
  - How many nodes?
  - For how long?
  - Which parameters?
- After running
  - Performance as "expected"?
  - Problem in the app or the platform?

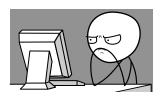

**Typical Performance Evaluation Questions** (Given my application and a supercomputer)

- · Before running
  - · How many nodes?
  - For how long?
  - Which parameters?
- After running
  - Performance as "expected"?
  - Problem in the app or the platform?

So many large-scale runs, solely to tune performance?!?

Holy Grail: Predictive Simulation on a "Laptop"
Capture the whole application and platform complexity

#### Thesis contributions (towards this goal)

- · Case study: High Performance Linpack (HPL)
- Extensive (in)validation, comparing simulations with reality
- Modeling correctly the platform variability is key

#### Thesis contributions (towards this goal)

- · Case study: High Performance Linpack (HPL)
- Extensive (in)validation, comparing simulations with reality
- · Modeling correctly the platform variability is key

#### Thesis contributions (made on the way)

- · Automation (of experiments, statistical analyzes, etc.)
- · Experiment methodology, to bias or not to bias
- Performance tests, to detect eventual platform changes

PERFORMANCE PREDICTION

THROUGH SIMULATION

#### SIM(EM)ULATION: THE SMPI APPROACH

- · C/C++/F77/F90 codes run unmodified out of the box
- · Simply replace mpicc/mpirun by smpicc/smpirun

#### SIM(EM)ULATION: THE SMPI APPROACH

- · C/C++/F77/F90 codes run unmodified out of the box
- Simply replace mpicc/mpirun by smpicc/smpirun

- · Computations run for real on a laptop
- Communications are faked, good fluid network models
- Performance model for the target platform

#### SIM(EM)ULATION: THE SMPI APPROACH

- · C/C++/F77/F90 codes run unmodified out of the box
- Simply replace mpicc/mpirun by smpicc/smpirun

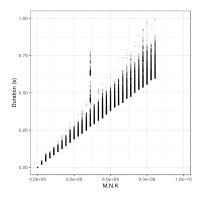

#### Emulation: how?

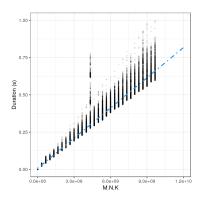

- · Computations run for real on a laptop
- Communications are faked, good fluid network models
- Performance model for the target platform

**Contribution**: Skip the expensive computations (mostly **dgemm**) and replace them by performance models

dgemm(M, N, K) =

 $dgemm(M, N, K) = \alpha.M.N.K$ 

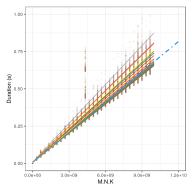

$$\mathsf{dgemm}_i(M,N,K) = \underbrace{\alpha_i.M.N.K}_{\mathsf{per\ host}}$$

#### Different color ⇒ different host

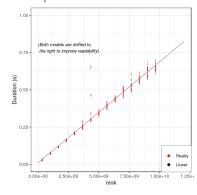

$$\mathsf{dgemm}_i(M,N,K) = \underbrace{\alpha_i.M.N.K}_{\mathsf{per}\;\mathsf{host}}$$

#### Different color ⇒ different host

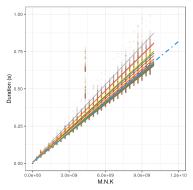

### For a particular host

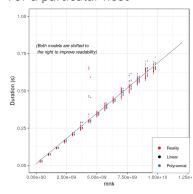

$$\operatorname{dgemm}_{i}(M, N, K) = \underbrace{\alpha_{i}.M.N.K}_{\text{per host}} + \underbrace{\beta_{i}.M.N + \gamma_{i}.N.K + \dots}_{\text{polynomial model}}$$

#### Different color ⇒ different host

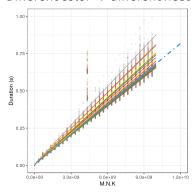

#### For a particular host

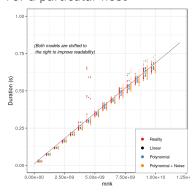

$$\mathsf{dgemm}_i(M,N,K) = \underbrace{\alpha_i.M.N.K}_{\mathsf{per}\,\mathsf{host}} + \underbrace{\beta_i.M.N + \gamma_i.N.K + \dots}_{\mathsf{polynomial}\,\mathsf{model}} + \underbrace{\mathcal{N}(0,\alpha_i'.M.N.K + \dots)}_{\mathsf{polynomial}\,\mathsf{noise}}$$

#### Different color ⇒ different host

#### For a particular host

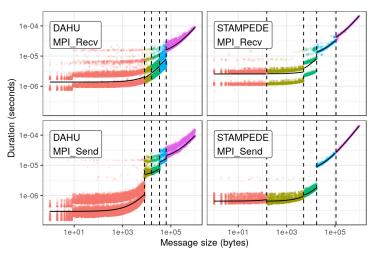

#### MODELING COMMUNICATIONS

**Hand-crafted non-blocking collective operations** intertwinned with computations

#### MODELING COMMUNICATIONS

**Hand-crafted non-blocking collective operations** intertwinned with computations

Experimental biases when measuring dgemm or MPI durations Effect on durations, but also other metrics (e.g. CPU frequency)

· Sampling method for generating the sequence of calls

- · Sampling method for generating the sequence of calls
- Sample itself (for a given sampling method)

- · Sampling method for generating the sequence of calls
- · Sample itself (for a given sampling method)
- · Interferences between computations and communications

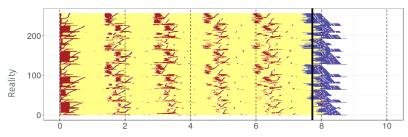

- · Sampling method for generating the sequence of calls
- · Sample itself (for a given sampling method)
- · Interferences between computations and communications
- $\cdot$  Content of the matrices used by  $\operatorname{dgemm}$

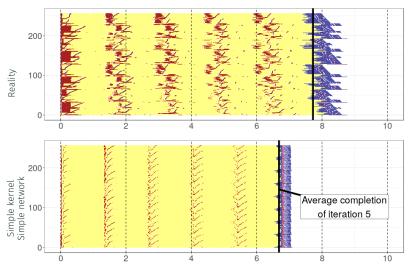

Experimental biases when measuring dgemm or MPI durations
Effect on durations, but also other metrics (e.g. CPU frequency)

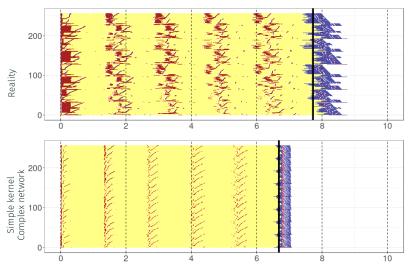

- · Sampling method for generating the sequence of calls
- · Sample itself (for a given sampling method)
- · Interferences between computations and communications
- Content of the matrices used by dgemm

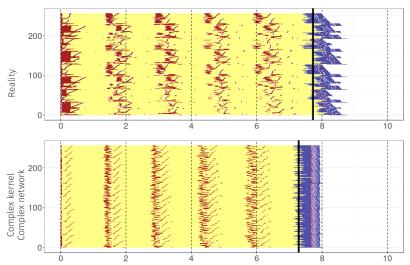

Bias may be desirable in some situations

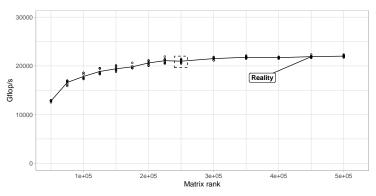

VALIDATING THE PREDICTIONS

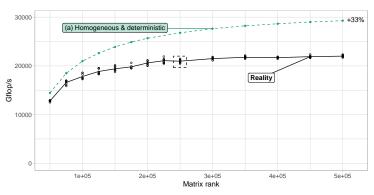

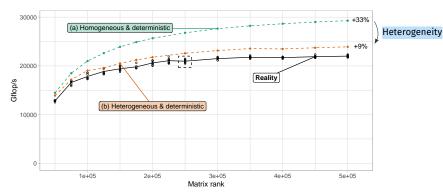

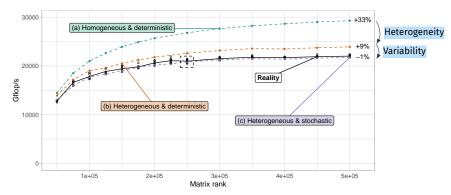

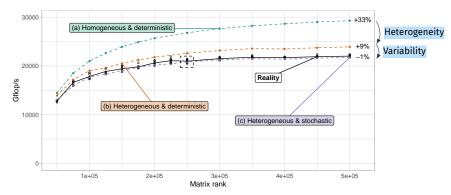

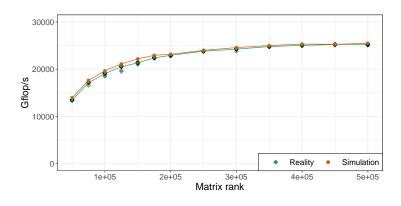

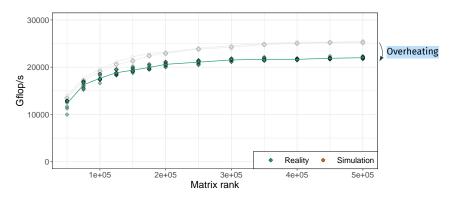

Now the complete run, with 1024 MPI ranks

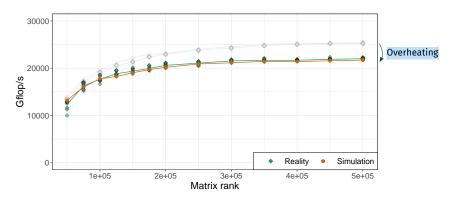

Take-Away Message: accurate prediction

Modeling both **spatial** and **temporal** computation variability is essential

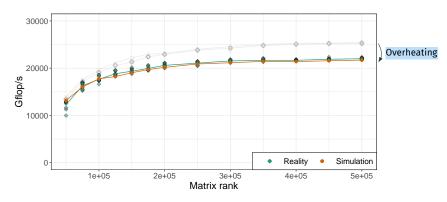

On four nodes, the cooling system malfunctionned for several weeks

On four nodes, the cooling system malfunctionned for several weeks

On four nodes, the cooling system malfunctionned for several weeks

**Take-Away Message**: Re-measuring **dgemm** durations to generate a new model was enough to account for the platform change

# PERFORMANCE TESTS

On a near-daily basis, run the dgemm calibration code on 🛊 Grid'5000 454 nodes (792 CPU) from 12 clusters

On a near-daily basis, run the **dgemm** calibration code on 454 nodes (792 CPU) from 12 clusters

For each CPU, collect:

- · average dgemm performance
- dgemm coefficients of regression (i.e. the model for simulation)

On a near-daily basis, run the dgemm calibration code on

For each CPU, collect:

· average dgemm performance

454 nodes (792 CPU) from 12 clusters

- dgemm coefficients of regression (i.e. the model for simulation)
- · average CPU frequency
- · average CPU power consumption
- average DRAM power consumption
- · average temperature

For each CPU, collect:

· average dgemm performance

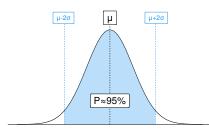

454 nodes (792 CPU) from 12 clusters

- dgemm coefficients of regression (i.e. the model for simulation)
- · average CPU frequency
- · average CPU power consumption
- · average DRAM power consumption
- · average temperature

Each parameter is normally distributed (thanks to CLT)

## FLUCTUATION INTERVAL

Given a sequence of old observations  $x_1, ..., x_n$  and a new observation  $x_{n+1}$ , how likely was it to observe  $x_{n+1}$ ?

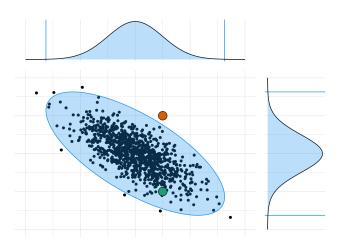

Take the sample mean  $\mu$  and standard deviation  $\sigma$  of the old observations

$$\mathbb{P}\left(\mathbf{X}_{n+1} \in \left[\mu - 2\sigma; \mu + 2\sigma\right]\right) \approx 95\%$$

#### FLUCTUATION INTERVAL FOR SEVERAL VARIABLES

With several variables, using their covariance matrix Example in dimension 2, with  $\mathbb{P}(x_{n+1} \in \text{interval}) \approx 99.5\%$ 

#### FLUCTUATION INTERVAL FOR SEVERAL MEASURES

With several measures, using their average and shrinking the interval Example with 5 measures (averages represented by crosses)
